Paper 1 Computational thinking and programming skills

Mark scheme

June 2025

Version: 1.0 Final

Mark schemes are prepared by the Lead Assessment Writer and considered, together with the relevant questions, by a panel of subject teachers. This mark scheme includes any amendments made at the standardisation events which all associates participate in and is the scheme which was used by them in this examination. The standardisation process ensures that the mark scheme covers the students' responses to questions and that every associate understands and applies it in the same correct way. As preparation for standardisation each associate analyses a number of students' scripts. Alternative answers not already covered by the mark scheme are discussed and legislated for. If, after the standardisation process, associates encounter unusual answers which have not been raised they are required to refer these to the Lead Examiner.

It must be stressed that a mark scheme is a working document, in many cases further developed and expanded on the basis of students' reactions to a particular paper. Assumptions about future mark schemes on the basis of one year's document should be avoided; whilst the guiding principles of assessment remain constant, details will change, depending on the content of a particular examination paper.

This mark scheme contains the correct responses which we believe that candidates are most likely to give. Other valid responses are possible to some questions and should be credited. Examiners should refer responses that are not covered by the mark scheme, but which they deem creditworthy, to a Team Leader.

No student should be disadvantaged on the basis of their gender identity and/or how they refer to the gender identity of others in their exam responses.

A consistent use of 'they/them' as a singular and pronouns beyond 'she/her' or 'he/him' will be credited in exam responses in line with existing mark scheme criteria.

Further copies of this mark scheme are available from aqa.org.uk

The following annotation is used in the mark scheme:

- ;** - means a single mark
- //** - means alternative response
- /** - means an alternative word or sub-phrase
- A** - means acceptable creditworthy answer. Also used to denote a valid answer that goes beyond the expectations of the GCSE syllabus.
- R** - means reject answer as not creditworthy
- NE** - means not enough
- I** - means ignore
- DPT** - in some questions a specific error made by a candidate, if repeated, could result in the candidate failing to gain more than one mark. The DPT label indicates that this mistake should only result in a candidate losing one mark on the first occasion that the error is made. Provided that the answer remains understandable, subsequent marks should be awarded as if the error was not being repeated.

Note to Examiners

In the real world minor syntax errors are often identified and flagged by the development environment. To reflect this, all responses in a high-level programming language will assess a candidate's ability to create an answer using precise programming commands/instructions but will avoid penalising them for minor errors in syntax.

When marking program code, examiners must take account of the different rules between the languages and only consider how the syntax affects the logic flow of the program. If the syntax is not perfect but the logic flow is unaffected then the response should not be penalised.

The case of all program code written by students is to be ignored for the purposes of marking. This is because it is not always clear which case has been used depending on the style and quality of handwriting used.

Examiners must ensure they follow the mark scheme instructions exactly. If an examiner is unsure as to whether a given response is worthy of the marks they must escalate the question to their team leader.

Level of response marking instructions

Level of response mark schemes are broken down into levels, each of which has a descriptor. The descriptor for the level shows the average performance for the level. There are marks in each level.

Before you apply the mark scheme to a student's answer read through the answer and annotate it (as instructed) to show the qualities that are being looked for. You can then apply the mark scheme.

Step 1 Determine a level

Start at the lowest level of the mark scheme and use it as a ladder to see whether the answer meets the descriptor for that level. The descriptor for the level indicates the different qualities that might be seen in the student's answer for that level. If it meets the lowest level then go to the next one and decide if it meets this level, and so on, until you have a match between the level descriptor and the answer. With practice and familiarity, you will find that for better answers you will be able to quickly skip through the lower levels of the mark scheme.

When assigning a level, you should look at the overall quality of the answer and not look to pick holes in small and specific parts of the answer where the student has not performed quite as well as the rest. If the answer covers different aspects of different levels of the mark scheme you should use a best fit approach for defining the level and then use the variability of the response to help decide the mark within the level, ie if the response is predominantly level 3 with a small amount of level 4 material it would be placed in level 3 but be awarded a mark near the top of the level because of the level 4 content.

Step 2 Determine a mark

Once you have assigned a level you need to decide on the mark. The descriptors on how to allocate marks can help with this. The exemplar materials used during standardisation will help. There will be an answer in the standardising materials which will correspond with each level of the mark scheme. This answer will have been awarded a mark by the Lead Examiner. You can compare the student's answer with the example to determine if it is the same standard, better or worse than the example. You can then use this to allocate a mark for the answer based on the Lead Examiner's mark on the example.

You may well need to read back through the answer as you apply the mark scheme to clarify points and assure yourself that the level and the mark are appropriate.

Indicative content in the mark scheme is provided as a guide for examiners. It is not intended to be exhaustive and you must credit other valid points. Students do not have to cover all of the points mentioned in the Indicative content to reach the highest level of the mark scheme.

An answer which contains nothing of relevance to the question must be awarded no marks.

Question	Part	Marking guidance	Total marks
01	1	Mark is for AO2 (apply) C Line number 6; R. If more than one lozenge shaded	1

Question	Part	Marking guidance	Total marks
01	2	Mark is for AO2 (apply) C This program uses concatenation; R. If more than one lozenge shaded	1

Question	Part	Marking guidance	Total marks
01	3	Mark is for AO2 (apply) <; // Less than; R. =	1

Question	Part	Marking guidance	Total marks																								
01	4	4 marks for AO2 (apply) MP1: for the first value of column a and the first value of column b and the first value of column c all correct; MP2: for the correct first output (2); MP3: for the rest of column a correct and the rest of the Output column correct and neither containing any other values at the bottom of the columns; MP4: for the rest of column b correct and containing no other values; Maximum 3 marks if any errors. I. Different rows used as long as the order within columns is clear I. Duplicate values on consecutive rows within a column <table border="1"> <thead> <tr> <th>a</th><th>b</th><th>c</th><th>Output</th></tr> </thead> <tbody> <tr> <td>1</td><td>1</td><td>5</td><td></td></tr> <tr> <td>2</td><td>2</td><td></td><td>2</td></tr> <tr> <td>4</td><td>3</td><td></td><td>4</td></tr> <tr> <td>8</td><td>4</td><td></td><td>8</td></tr> <tr> <td>16</td><td>5</td><td></td><td>16</td></tr> </tbody> </table>	a	b	c	Output	1	1	5		2	2		2	4	3		4	8	4		8	16	5		16	4

Question	Part	Marking guidance	Total marks
07	4	Mark is for AO2 (apply) <code>number;</code> I. Case	1

Question	Part	Marking guidance	Total marks
07	5	2 marks for AO1 (understanding) Maximum of 2 marks from: • (is) modularised // broken down into sections/chunks // (uses) subroutines // named/out of line blocks of code; • (uses) parameters; • (uses) return values; • (uses) local variables; • (uses) selection; • (uses) iteration; • (uses) well documented interfaces;	2

Question	Part	Marking guidance	Total marks																								
08	1	5 marks for AO2 (apply) MP1: for b1 column and b2 column correct and no other values in either column; MP2: for the first value of i initialised to 0; MP3: for the last three rows of column i correct and no other values; MP4: for the first value in new set to '0' or the first value in new set to an empty string/blank value followed by '0'; MP5: for the last three rows of column new correct and no other values; Maximum 4 marks if any errors. <table border="1" data-bbox="564 1397 1209 1816"> <thead> <tr> <th>b1</th><th>b2</th><th>new</th><th>i</th></tr> </thead> <tbody> <tr> <td>'0010'</td><td>'0111'</td><td>' '</td><td>0</td></tr> <tr> <td></td><td></td><td>'0'</td><td>1</td></tr> <tr> <td></td><td></td><td>'01'</td><td>2</td></tr> <tr> <td></td><td></td><td>'010'</td><td>3</td></tr> <tr> <td></td><td></td><td>'0101'</td><td></td></tr> </tbody> </table> I. Different rows used as long as the order within columns is clear I. Duplicate values on consecutive rows within a column I. Missing quotes used around strings.	b1	b2	new	i	'0010'	'0111'	' '	0			'0'	1			'01'	2			'010'	3			'0101'		5
b1	b2	new	i																								
'0010'	'0111'	' '	0																								
		'0'	1																								
		'01'	2																								
		'010'	3																								
		'0101'																									

Question	Part	Marking guidance	Total marks
08	2	Mark is for AO2 (apply) So the algorithm does not attempt to access a character that does not exist (in the string); // So the algorithm does not attempt to use an index value that is out-of-range; // Because indexing (of strings) starts at 0 rather than 1; A. To make sure it doesn't crash (when run as a program) ; A. To prevent a run-time error from happening;	1

Question	Part	Marking guidance	Total marks																		
09		2 marks for (AO2 apply) MP1: for any three columns correct; MP2: for all columns correct; <table><tr><td></td><td>A</td><td>B</td><td>C</td><td>D</td><td>E</td></tr><tr><td>Algorithm totals the five values</td><td>✓</td><td>✓</td><td></td><td></td><td></td></tr><tr><td>Algorithm does not total the five values</td><td></td><td></td><td>✓</td><td>✓</td><td>✓</td></tr></table> R. column if more than 1 tick in that column		A	B	C	D	E	Algorithm totals the five values	✓	✓				Algorithm does not total the five values			✓	✓	✓	2
	A	B	C	D	E																
Algorithm totals the five values	✓	✓																			
Algorithm does not total the five values			✓	✓	✓																

Question	Part	Marking guidance	Total marks
10	1	Mark is for AO2 (apply) <code>Runner('200 m', 10, 32.59);</code> I. Case R. if quotes, commas or parentheses missing	1

Question	Part	Marking guidance	Total marks
10	2	Mark is for AO2 (apply) <code>.time;</code> I. Case R. if period is missing	1

Question	Part	Marking guidance	Total marks
10	3	1 mark for AO3 (design), 5 marks for AO3 (program) Program Design Note that AO3 (design) marks are for selecting appropriate techniques to use to solve the problem, so should be credited whether the syntax of programming language statements is correct or not and regardless of whether the solution works. Mark A for attempting to calculate the length of the array <code>times</code>; Program Logic Mark B for initialising a variable to an appropriate numeric value to store the fastest time or the index to the fastest time; Mark C for using a loop to correctly iterate through an array of any length; Mark D for correctly checking values (on at least 2 occasions) in the <code>times</code> array are smaller than the current fastest time (even if the indexing is incorrect); Mark E correctly store the current fastest time/position of the fastest time for each iteration (indexing must be correct); Mark F for outputting the fastest time from a variable once, in an appropriate place; Note to Examiners If used built in routines to find the smallest value in an array or to sort the array then do not award marks D, E I. Case I. Gaps/spaces throughout the code, except where to do so would explicitly alter the logic of the code in a way that makes it incorrect. Maximum 5 marks if any errors in code. Note to examiners In C#/VB.NET examples, explicit variable declarations are not shown. Refer to the specific language type issues section of the appropriate Marking Guidance document. Any correct variable declarations in student answers should be accepted.	6

	<u>C# Example 1 (fully correct)</u> All design marks are achieved (Mark A) <pre>length = times.Length; best = times[0]; for (i = 0; i < length; i++) { if (times[i] < best) { best = times[i]; } } Console.WriteLine(best);</pre> A. Write in place of WriteLine; I. missing Console. <u>C# Example 2 (fully correct)</u> All design marks are achieved (Mark A) <pre>best = times[0]; foreach (time in times) { if (time < best) { best = time; } } Console.WriteLine(best);</pre> A. Write in place of WriteLine; I. missing Console. <u>Python Example 1 (fully correct)</u> All design marks are achieved (Mark A) <pre>length = len(times) best = times[0] for i in range(length): if times[i] < best: best = times[i] print(best)</pre> <u>Python Example 2 (fully correct)</u> All design marks are achieved (Mark A) <pre>best = times[0] for time in times: if time < best: best = time print(best)</pre> <u>Python Example 3 (fully correct)</u> All design marks are achieved (Mark A) <pre>lowest = 0 for i in range(0, len(times)): if times[i] < times[lowest]: lowest = i print(times[lowest])</pre>	Part of C B, Part of D Part of C Part of D E F B, Part of D C Part of D E F Part of C B, Part of D Part of C Part of D E F B, Part of D C Part of D E F B, Part of D C Part of D E F
--	---	---

		<u>VB.NET Example 1 (fully correct)</u> All design marks are achieved (Mark A) <pre> length = times.Length best = times(0) For i = 1 to length - 1 If times(i) < best Then best = times(i) End If Next Console.WriteLine(best) </pre> Part of C B, Part of D Part of C Part of D E F A. Write in place of WriteLine; I. missing Console. <u>VB.NET Example 2 (fully correct)</u> All design marks are achieved (Mark A) <pre> best = times(0) For Each time In times If time < best Then best = time End If Next Console.WriteLine(best) </pre> B, Part of D C Part of D E F A. Write in place of WriteLine; I. missing Console.

Question	Part	Marking guidance	Total marks
11	1	Mark is for AO2 (apply) B s; R. If more than one lozenge shaded	1

Question	Part	Marking guidance	Total marks
11	2	Mark is for AO2 (apply) A s; R. If more than one lozenge shaded	1

Question	Part	Marking guidance	Total marks
11	3	Mark is for AO2 (apply) C 6; R. If more than one lozenge shaded	1

Question	Part	Marking guidance	Total marks
11	4	Mark is for AO2 (apply) C <code>sys*em;</code> R. If more than one lozenge shaded	1

Question	Part	Marking guidance	Total marks
11	5	2 marks for AO3 (design), 8 marks for AO3 (program) <u>Program Design</u> Note that AO3 (design) marks are for selecting appropriate techniques to use to solve the problem, so should be credited whether the syntax of programming language statements is correct or not and regardless of whether the solution works. Mark A for creating a new iteration construct that exists within their language and inputting a letter within it; Mark B for the use of a selection structure for both the messages about winning and losing; <u>Program Logic</u> Mark C for an iteration structure that correctly allows a letter to be entered a maximum of 8 times (I. any reference to exiting the loop based on the number of asterisks); Mark D for an iteration structure that exits correctly when there are no asterisks left in <code>hidden</code> and there is a correct boolean joining operator for BOTH conditions (See Mark C for second condition); Mark E for correctly calling the <code>findLetter</code> subroutine within an iteration structure (even if the parameters are incorrect or missing); Mark F for including the correct parameters in the correct order when calling the <code>findLetter</code> subroutine; Note: the middle parameter should match the variable name their user input has been assigned to. Mark G for updating the <code>hidden</code> variable with the return value from the call to <code>findLetter</code>; R. if <code>hidden</code> is re-initialised within the iteration structure Mark H for correctly checking to see if there are any asterisks left in <code>hidden</code> and handling it appropriately; Mark I for displaying the value of <code>hidden</code> after each attempt; Mark J for displaying <code>You won</code> and <code>You lost</code> in appropriate places under the correct conditions;	10

	Note to Examiners If used built in routines to check if a string contains another string/character or to count the number of asterisks then do not award marks D and H I. Case I. Messages or no messages with input statements I. Gaps/spaces throughout the code, except where to do so would explicitly alter the logic of the code in a way that makes it incorrect. Maximum 9 marks if any errors in code. Note to examiners In C#/VB.NET examples, explicit variable declarations are not shown. Refer to the specific language type issues section of the appropriate Marking Guidance document. Any correct variable declarations in student answers should be accepted. <u>C# Example 1 (fully correct)</u> All design marks are achieved (Marks A and B) <pre> won = false; for (i = 0; i < 8; i++) { letter = Console.ReadLine(); hidden = findLetter(word, letter, hidden); Console.WriteLine(hidden); won = true; for (j = 0; j < hidden.Length; j++) { if (hidden[j] == '*') { won = false; } } if (won == true) { break; } } if (won == false) { Console.WriteLine("You lost"); } else { Console.WriteLine("You won"); } </pre> A.
