SECTION B

Answer ALL questions in the spaces provided.

- 6 A student has been asked to carry out an experiment to determine the internal resistance of a 1.5 V cell. The circuit will contain the following components: the cell, a switch, a variable resistor, an ammeter and a voltmeter.

(a) Draw a circuit diagram of the circuit.

(1)

(b) State why this experiment is considered to be low risk.

(1)

(c) The teacher says that the resistance of the variable resistor should **not** be reduced to zero.

Suggest why.

- 7 A student is asked to plan an experiment to determine the energy stored in a stretched spring when it is extended by 300 mm. The student is told to use a graphical method.

For a 1 N load the extension of the spring is 40 mm.

Write a plan which could be used for this experiment.

You should:

- (a) draw a labelled diagram of the experimental set-up and list any additional apparatus required, (3)
- (b) state which quantity is the independent variable and which quantity is the dependent variable, (2)
- (c) state and explain your choice of measuring instruments for the independent and dependent variables, (4)
- (d) describe how you would ensure that your measurement of the extension is as accurate as possible, (2)
- (e) comment on whether repeat readings are appropriate in this case, (1)
- (f) explain how the data collected will be used to determine the energy stored, (4)
- (g) explain the main source of uncertainty and/or systematic error, (1)
